

We used the sanfran\_crime\_dataset database to determine the safest and most insecure areas based on the number and magnitude of the crime.

This dataset has 150500 rows and 12 columns. And it includes items such as place, time, address, type of crime, and so on.

After identifying the safest areas, select one of the three safest areas and use Foursquare location data to determine how many Asian and Japanese restaurants there are in each area, then the area with the least number of Japanese or Asian restaurants. We will introduce it to our customer.
